

Chinook Salmon, Coho Salmon and Steelhead Run-size Estimates Trinity River, CA

CDFG and program partners, funded by the TRRP, have operated main stem weirs for the purpose of developing mark-recapture run estimates since 1977. Trinity River Basin salmon and steelhead run estimates are essential to evaluating TRRP program success. The data collected at the weirs include long term population trend data, harvest and escapement estimates, hatchery and wild contributions, run timing, and age structure estimates.
